## 1. Primitive Data Types and Control Statements

- (a) List Java's eight primitive types, along with the range of each of the integer types. [3]
- (b) Java can convert variables between various types.
  - i. Explain, with examples, the difference between an *implicit typecast* and an *explicit typecast*. [4]
  - ii. Given the following code, what will the output be and why? [3]

```
public static void main(String args[]) {
    short a = 3450;
    byte b = (byte) a;
    System.out.println(b);
}
```

(c) Program control in Java can be managed using if and switch statements. Rewrite the following code in the most concise form possible using a switch statement. [5]

(d) Given the following code,

```
int a = 1, b = 2;
if (a == 1)
   if (b == 3) System.out.println("A is 1 and B is 3");
else
        System.out.println("A is not 1");
```

- i. What will the output be, and why?
- ii. Rewrite the code using a single if statement, and fix any semantic errors. [3]
